Asset Pricing, Financial Intermediation, Real Estate

EDUCATION

Pennsylvania State University (Smeal)
Ph.D. in Business Administration

University Park, PA
2022–2027 (expected)

University of Tokyo
M.A. in Economics
B.A. in Economics

Tokyo, Japan
2019–2020
2015–2019

PROFESSIONAL EXPERIENCE

Board of Governors of the Federal Reserve System
Dissertation Fellow, Division of Monetary Affairs

Washington, D.C.
Summer 2026

Deloitte Touche Tohmatsu LLC
Consultant, Deloitte Analytics

Tokyo, Japan
2020–2022

WORKING PAPERS

JOB MARKET PAPER

[1] **Who Holds U.S. Bonds and How It Shapes the Yield Effects of QE and QT**

How much do the bond-supply shifts of quantitative easing (QE) and tightening (QT) move yields? The answer turns on the slope of aggregate bond demand: who holds bonds, how sensitive their demand is to yields, and how fast they rebalance. I estimate heterogeneous investor demand in the U.S. bond market across four asset classes, Treasuries, agency MBS, corporate bonds, and municipal bonds, from sector-level portfolio-share data spanning 1985 to 2025, using granular, QE-shock, and heteroskedasticity-based instruments. I measure each sector's demand against the non-bond asset it actually trades off against, and I let each sector rebalance at its own speed. Both elasticities and speeds differ sharply across sectors: most investors are weakly yield-sensitive, and the sectors that ultimately absorb the most, insurers, pension funds, and mutual funds, complete only a fraction of their rebalancing on impact, reaching their long-run response over the following year. Because the inelastic sectors hold most of the market, aggregate demand is inelastic, and more so at low yields, which amplifies QE's price impact and dampens QT's. Feeding the estimated demand system through market clearing, I find that historical QE compressed yields substantially and spilled over to corporate and municipal markets. QT is smaller, a further \$900 billion of runoff raising Treasury yields by about 15 basis points and agency MBS yields by about 11, because demand is more elastic at the higher yields prevailing during QT.
